m However the part that is confusing me is the first example where there is no "attached data source". What exactly does that mean? Does that mean they don't use any user data or any particular data source? A: It means they didn't use their own data, either on Kaggle or elsewhere. In this case, they just used to get data. In this case, they don't care if it's their data or not. Also, while they don't have any attached data, they did have an idea of where to look for data. Q: If I am learning a new language, is it better to pick up the language from scratch or to study a beginner's book? How would you advise a beginner to approach learning a new language? A good book that's probably overkill for a beginner's level book, but that will get you up to speed fast enough, is the Art of Computer Programming. It's old, but it will give you a good grounding in the fundamentals, and a foundation from which you can build. I've read a few beginner-level books and some of them were very useful, but a lot were a bit light on the "daily life" stuff. The Art of Computer Programming is a great book, but I think the ACM Book of Abstract Algorithms might be better suited to someone just starting out in programming (it is really geared towards the CS major). It also covers a lot of the theory behind the algorithms, which is important, but I find the practical examples to be pretty eye-opening for me personally. Some of the other books I've read have been of questionable value. A few other things that might be useful for a beginner are: Accelerated C++ 4th Edition C++ How to Program C++ Primer Plus C++ Bible C++ Primer Java for Programmers C# in Depth The Art of Computer Programming: Basic Concepts and Techniques from Algorithms to Computer
